

## SIGHT GLASS

### SIGHT GLASS

#### Description:

LynCar's Sight Glass is cast from high quality brass alloy. This assures lasting performance and serviceability.

Available with "restricted orifice" design. Flow can be viewed through two high impact Lexan (polycarbonate) windows on either side of the sight glass. All models feature male by female thread patterns for easy "in line" installation.

The restricted orifice types can be used to simulate system sprinkler head flow which can be viewed through either window.

#### Installation:

Installation can be made using readily available field tools and materials. Apply a suitable pipe thread sealant to either the male or female threads. The brass sight glass must be installed so the direction of flow is from the female thread to the male thread. This allows the restricted stream to be viewed through the Lexan (polycarbonate) windows. The sight glass threads have been machined according to standard iron pipe thread specifications. Installation is similar to other threaded fittings.

**Caution: Do not over tighten. Over tightening will cause the sight glass fitting to crack.**
